

# Homework 3 (file compression, disk/partition handling, some text utils)

- 1 How to set the output directory for all compression methods (unzip,tar,gunzip,bunzip2,unrar,7z,xz) different that the local directory? See the man pages or just google it;)
- 2 How to use df command to list only ext4 (or any other specific ) filesystem type mounts?
- 3 How to find out the mount options for a specific mount (google it, but we had the command on the last lecture just did not use it that way)?
- 4 How to use hdparm to check the read speed on a disk/partition (man pages, google)?
- 5 How to cut out all the columns from a file except the 8th? Also make sure the lines which do not contain delimiter are not prined at all (see man cut)
